- Both transistors were originally marked "TZ82." They may have been Silicon.
- Pot tapers are unknown. 350k is probably the "distortion" control and the 33k is probably the "volume" control. You can use 500k lin. for the distortion and 50k audio for the volume. Alternatively, you can place fixed resistors in parallel with these larger value pots to imitate 350k and 33k.
