

D3, D4 - unknown diodes (blue painted glass diodes, with "BKC" written on them)  
 C1 - ceramic capacitor  
 All electrolytic capacitors are rated at 10V.  
 All resistors are 5% carbon film resistors.

\*IN\* = DRIVE control (the first gain stage is a 2.Vex Super Hard On, so this knob is a "Crackle Okay" DRIVE control)  
 \*LIMIT\* = clips the original waveform off at about the same size as the harmonics  
 \*OUT\* = VOLUME control

This schematic has been traced from a 2001 model, with no LED nor power jack.  
 If you plan to add a power jack, you will need to add some power filtering to prevent 60Hz hum.
